

Personnel Carrier

Personnel Carriers - There is actually a range of leaf chains which are used in the material handling business all over the globe. A few functions could comprise use on forklift trucks and certain straddle carriers. Top quality leaf chain is complete together with unique design features such as high fatigue strength, maximum wear resistance, long service life and compact design.

Made out of highly specialized steel, link plates could deliver maximum resistance to breakage while working with heavy cargo.

Made specially out of durable steel, bearing pins bring excellent bending resistance hence extending the wear life of the chain.

The close control of the pin dimensions and the plate hole improves the inner plate movement. Once friction is lowered to a minimum, the chain can function much more economically and efficiently.

Pitch is the distance between each plate hole or pin. Pitch accuracy and pin hole diameters, that are the holes in link plates, is strictly maintained on every component all through their construction. This attention to part detail guarantees a precision performance and consistent movement of the leaf chain joints.
