

## Used Parts for Forklifts

Used Forklift Parts - Sooner or later, lift truck parts will wear and should be replaced. Acquiring brand new parts could become a pricey venture so one more idea is to purchase used forklift components. This could save a lot of cash in the end. It is a good idea to acquire used lift truck components that have been remanufactured. These parts will ensure that you are getting components that will work for a long time and be productive.

Remanufacturing worn out or broken components is a more cost effective way overall compared to rebuilding. With rebuilding components, just the parts that are broken or worn out get replaced, which means that other wearable components may break down soon after acquisition.

Remanufacturing however provides the best guarantee for used components. Reproduced components are taken apart and cleaned and then all wearable pieces are replaced. All wearable components are replaced regardless of age or wear which is one more rationale why reproduced components overall function so much better. Any part within the part is brand new and this offers far longer life to the second-hand part. Depending on the forklift components that are being redone, the cleaning process and the whole remanufacturing process would differ.

The engines are cleaned after a complete disassembly. Different engine parts like rings, pistons, spark plugs, filters, valves, and valve springs can be replaced during the process of remanufacturing. The engines are hot tested after reassembly to guarantee that there are no noise, no oil pressure problems, no leaks or any vacuum.

Transmissions are one more item which is oven cleaned after being disassembled. The transmission is then washed. A thorough examination is done in order to check for any cracks. Bushings, seals and bearings are all replaced. Normally, the replacement parts utilized on transmission parts meet OEM specifications.

Certain parts like for example torque converters, the alternator, the water pump, steer axles and the starter could obtain longer serviceability after being remanufactured and having all wearable parts replaced. The electronic control in the electric lift truck is maintained by the control card. This particular card could even be remanufactured with replacing all aged and worn out components. Not like other lift truck components the control card could only have the worn and aged parts replaced.

Components that are remanufactured have to be thoroughly inspected upon reassembly to ensure they are in good condition prior to being sold. When purchasing these parts, it is a good idea to be sure that they have undergone all of the proper testing and inspections. On certain bigger parts like engines, transmissions and steer axles, OEM specification replacement parts must be utilized.

The dealer of used forklifts and parts could guarantee that the remanufactured components have met OEM specifications and that these parts meet industry standards. Many details go into remanufacturing second-hand parts. This attention to detail provides more serviceability out of remanufactured parts compared to the parts that were just rebuilt.
